

#### COWL LIGHT ARM INSTALLATION TOOL

The smaller end of the dowel passes through the hole in the Cowl brace. This brace is located just under the gas tank at the corner of the cowl panel and firewall. Keep shoulder of tool pressed against the brace and hit the center punch pin. This will dimple the cowl panel at the correct location. From the outside of the car use a center punch to reverse the new dimple. Then drill a small hole. Increase the hole size using larger drill bits until you have drilled the desired 3/4 inch hole for the new cowl light arm.
